

Hydraulic vibrators in road construction

Task

To pre-compact the substructure of a road, the customer was looking for a hydraulic vibrator that meets the requirements. For various reasons the road construction company decided against a concrete paver.

Solution

For this task a Wyco® Hydraulic vibrator together with vibrating beams to pre-compact the substructure was recommended to the customer. Overall 2.8 km where processed in four sections of 700 m to each. The dimensions between both road verges was around 0.55 m in height and 7 m in length. With the help of a device, the hydraulic vibrator could be attached to the excavator shovel so that the operator could operate and control all work from the cab.
