

Diesel refueling

Task

The customer sells complete tanks for diesel, AdBlue® and other petroleum based liquids.

Problem

In this case, 100 pulses per liter output is required to connect to a specific electronic collector that is specified by the end customer and where the flow rate is relatively high.

Solution

Owing to the special measurement technology and the rugged design of Badger Meter oval gear meters, our Swedish distributor, Sikama, offered an oval gear meter type IOG HF (High Flow version) with an aluminum housing and ILR710 display. The end customer was so impressed with the technical benefits and keen pricing of the IOG® product that they placed an important order and are well satisfied with the delivered product and results.
